

OH MagicPremium Build your own sun

Since the invention of sunlamps over 100 years ago, the brand „Original Hanau“ stands for innovation and progress.

Again and again Original Hanau developed special products for new requirements and was able to proceed changes in the market.

This successful tradition will now be continued with the new UV assembling set.

So be a step ahead and offer your customers every season the optimal sunshine.

In our UV assembling set the new tube generation OH MagicPremium is used. These new tubes are characterized by enhanced UV-A and UV-B values.

Depending on the desired application, you can focus on an effective, immediate tanning (more UV-A) or production of new pigmentation (more UV-B).

Even the combination of both is possible. And in addition, the second generation of our Blue:Q lamps makes our UV assembling set perfect.

The UV assembling set by Original Hanau can offer an optimal and individual tanning within the current legal requirements.

UV assembling set individual tanning

The different effects of UV radiation on our body are influenced by the intensity, the spectral composition and timing of the irradiation. In addition, the current and individual sensitivity play a role.

With the new OH MagicPremium tubes from Original Hanau, you can equip your sunbeds to your current and individual needs.

UV assembling set A-Tan tubes

The OH MagicPremium A-Tan tubes have their output focused at approx. 370nm. The natural sun has only a lower intensity in this spectral range.

So, you can achieve a strong immediate pigmentation in a short time with the OH MagicPremium A-Tan tubes; if enough pigments are present.

UV assembling set B-Tan tubes

The OH MagicPremium B-Tan tubes have their output focused at about 350nm. The natural sun has a lower intensity in this spectral range, too.

Furthermore, they have an increased UV-B portion between 280nm and 315nm, which is reduced in other 3uro tubes. Especially in the winter time, when the natural sun is too weak, OH MagicPremium tubes can provide a reliable source of Vitamin D.

And the B-Tan tubes can guarantee a stable dose during the process of building new pigmentation.
